

# Using Medicaid Claims to Assess Registry Data Completeness

Kevin Dombkowski, DrPH, MS  
Lisa Cohn MS  
Sarah Clark, MPH

*Funded through the Michigan Department of Community Health*

# Background

---

## The Michigan Childhood Immunization Registry (MCIR):

- tracks vaccinations for children  $\leq 21$  yrs. and reporting to MCIR is mandatory
- >2.8 million children
- >32 million immunization doses
- used widely by public and private providers
- data completeness remains an important concern

# Background

---

- MCIR is especially important for assessing coverage among Medicaid enrollees:
  - MCIR is approved by NCQA for health plan HEDIS reporting
  - health plans have found MCIR-based HEDIS reports to be easier and less costly

# Objective

---

To assess the completeness of MCIR vaccination records using Medicaid administrative claims data

# Methods Overview

---

## **Study Design:**

- Retrospective analysis of Michigan Medicaid administrative claims and MCIR vaccination records

## **Study population:**

- 0-6 years of age having  $\geq 1$  primary vaccination visit
- continuously enrolled in Medicaid during 2002

## **Data source:**

- Michigan Department of Community Health data warehouse

# Methods Overview

---

## **Medicaid claims data:**

- All 2002 claims selected for well-child exams, sick visits, and vaccinations
- Claims selection qualified using CPT procedure codes and ICD-9 CM dx codes

## **MCIR vaccination records:**

- All vaccination records for 2002
- Linked MCIR Child ID to Medicaid ID
- Subset vaccinations to 0-6 year olds

# Methods Overview

---

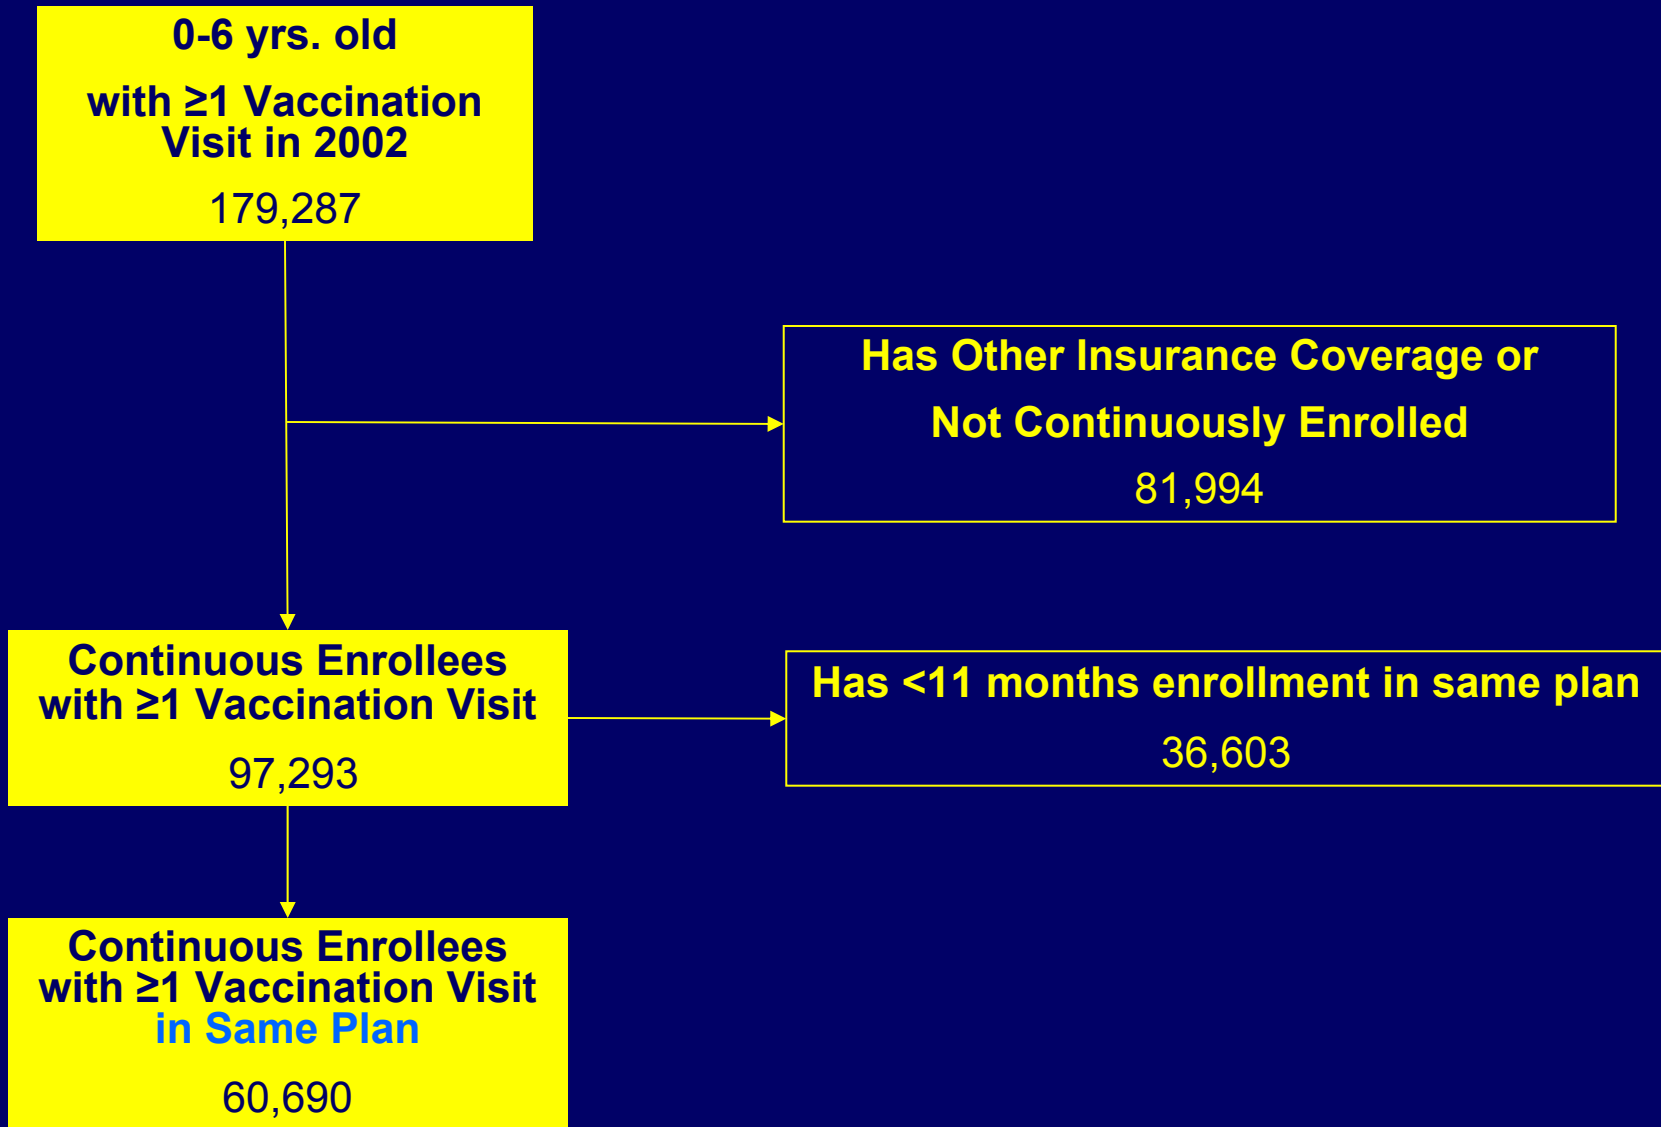

## **Outcomes measured:**

- vaccination events - one or more vaccination for a child on a given date
- percent agreement between Medicaid and MCIR vaccination events
- percent completeness of field that indicates whether a record is for dose administered / history entered

## **Statistical analysis:**

- Univariate descriptive statistics
- Bivariate analyses conducted using chi-square tests of association

# Study Population

# Results

---

<b>Characteristic</b>	<b>Enrollees</b> n = 97,293 (%)
0-2 Yrs.	60
3-6 Yrs.	40
Male	51
White	52
Black	38
All Others	10
Urban Location	83
Same Health Plan ≥ 11 Months	62

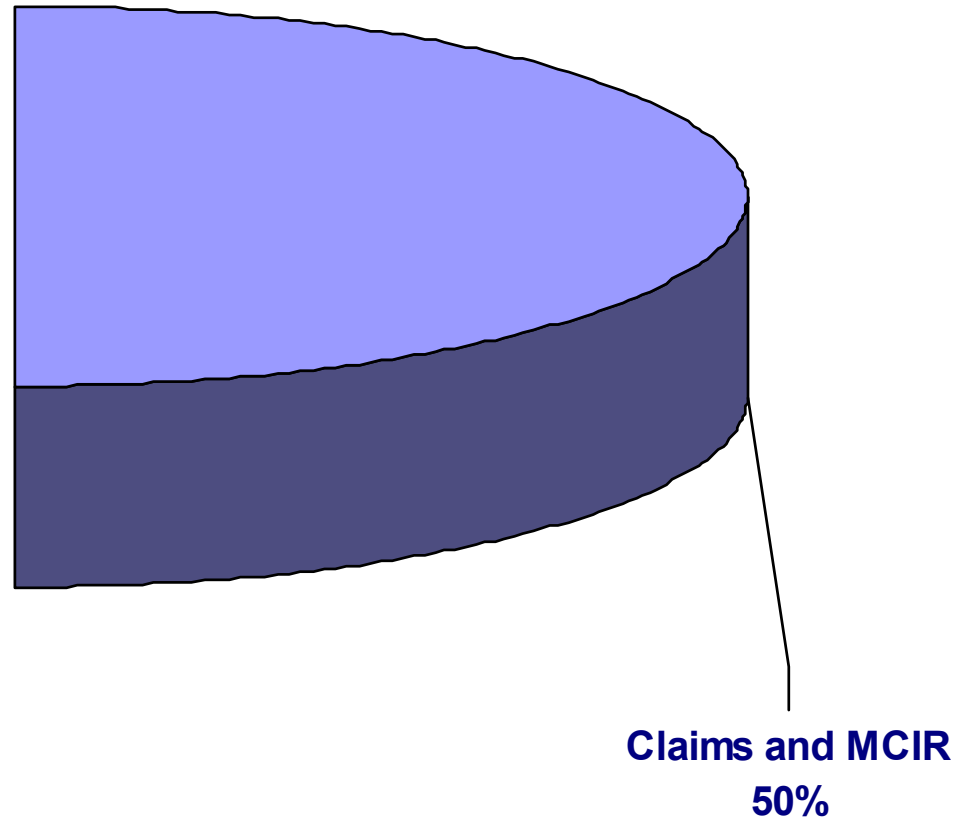

# Results

---

- A total of 185,425 vaccination events
- The majority of vaccinations were administered to:
  - children under 3 yrs. 76%
  - children in urban areas 83%
  - continuous plan enrollees 56%
- Most vaccinations were by private providers:
  - Local Health Dept. 16%
  - Private 75%
  - Unknown provider type 8%

# Most vaccination events located in MCIR:

# Most vaccination events located in MCIR:

# Most vaccination events located in MCIR:

# Results

---

- MCIR completeness varies substantially by:
  - age of child
  - type provider
  - geographic region
  - health plan

# Completeness by Age

<b>Characteristic</b>		<b>Vaccinations</b>	<b>MCIR and Claims</b>	<b>MCIR Only</b>	<b>Claims Only</b>

---

# Completeness by Urban Residence

---

	<b>Characteristic</b>	<b>Vaccinations</b>	<b>MCIR and Claims</b>	<b>MCIR Only</b>	<b>Claims Only</b>
		(n=185,425)	(%)	(%)	(%)
<b>Residence</b>	Urban	153,136	49	30	21
	Not Urban	32,289	55	31	14

---

# Completeness by Region

---

- MCIR completeness varies by geographic region:
  - Lowest – 78%
  - Highest – 86%

# Completeness by Region

0-2 yrs.

# Completeness by Region

3-6 yrs.

# Completeness by Health Plan

---

- Analysis of health plans focused on continuous enrollees in same plan
- 103,818 vaccinations (56% of total)
- MCIR completeness by plan:
  - Highest – 92%
  - Lowest – 56%
  - FFS – 82%

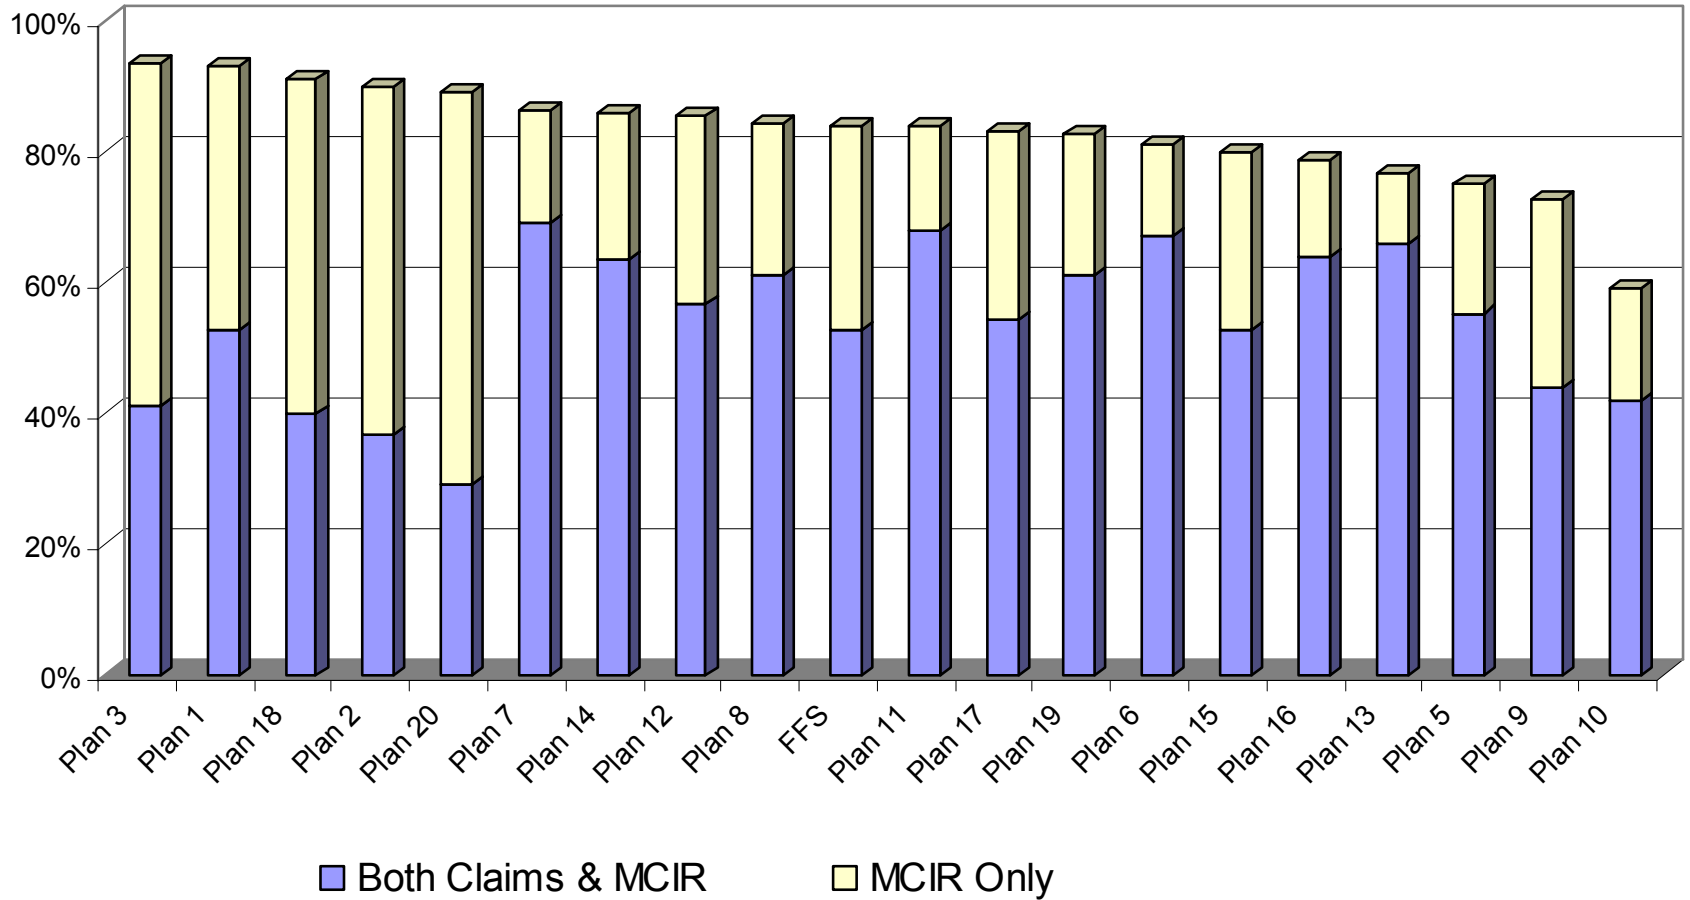

# 2002 Primary Series Vaccination Events

## Medicaid Enrollees 0-2 Years Old

# 2002 Primary Series Vaccination Events

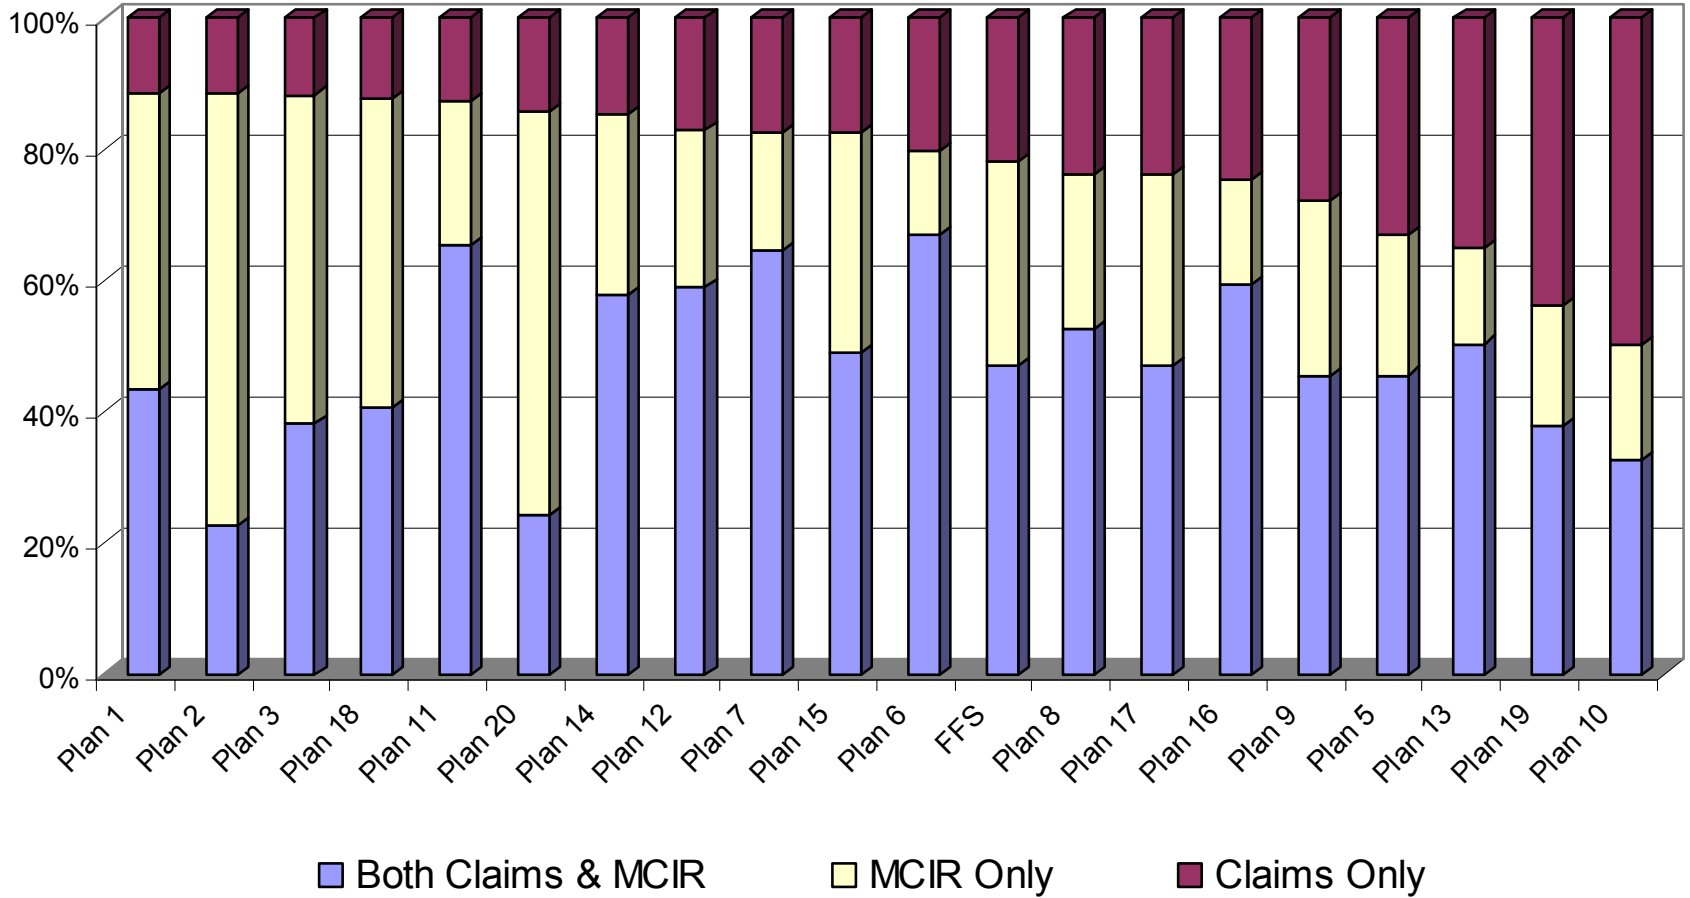

## Medicaid Enrollees 0-2 Years Old

## 2002 Primary Series Vaccination Events Medicaid Enrollees 0-2 Years Old

## 2002 Primary Series Vaccination Events Medicaid Enrollees 3-6 Years Old

# Identifying Administering Providers

---

- Dose administered / history code:
  - Tracks whether dose was administered or report vaccination history
  - Many doses are submitted to MCIR by batch process
  - 33% of vaccinations had missing codes
  - Difficult to determine administering provider records

# Limitations

---

- Results reflect Medicaid enrollees only; MCIR completeness among other children may differ
- Claims data cannot reliably determine dose type

# Conclusions

---

- MCIR completeness is:
  - highest among children < 36 months
  - lowest in urban areas
  - variable across health plans
- Provider profiling is limited by missing indicators for doses administered vs. history

# Implications

---

- Important to continue MCIR efforts that focus on improving data quality
- Target MCIR outreach to urban providers
- Institute changes in MCIR design / data submission to improve completeness for vaccination administered / history indicator
