Surveillance for sexually transmitted infections (STI) in England is performed using the Genitourinary Medicine Clinic Activity Dataset version 2 (GUMCADv2).

**Objectives:**

- To determine the feasibility of enhancing GUMCADv2 to collect behavioural and PN outcome variables routinely
- To determine the acceptability of this enhancement to GUM clinicians

**Methods:**

- Pilot and GUMCADv2 data merged on clinic ID, patient ID and attendance date
- Restricted to all new/rebook patients at 6 pilot sites for 4–8 consecutive weeks
  - Specialist and non-specialist GUM (or ‘STD’) clinics
  - Geographical representation
  - Different patient populations
  - Different software providers

**Preliminary feedback:**

- GUMCADv3 is acceptable
- Collection of this additional information by modification of clinics’ electronic patient record (EPR) systems

**PILOT**

**Results:**

- Number of MSM partners reported, by type of partner
  - Total: 1,430
  - Male: 1,358
  - Female: 32
  - Non-male: 4
- Number of attendances reporting a total of 1,430 male partners
  - MSW (MSW + NSW): 3

**Data quality:**

- Comparison of GUMCADv2 data with data collected through routine national surveillance: a pilot study in England
- Comparison of GUMCADv2 data with data collected through routine national surveillance: a pilot study in England
- Comparison of GUMCADv2 data with data collected through routine national surveillance: a pilot study in England
